Limani Labs Email check report

Domain: etaireia-sas.example · 13 Oct 2026, 11:54

etaireia-sas.example: problem found

Others can send email that looks like yours, and it may arrive.

- **SPF: Problem.** Missing. Without SPF, receivers cannot check which servers may send email in your name.
- **DMARC: Problem.** Missing. Without DMARC, receivers have no instruction for messages that show your domain but fail the check. And you do not get the reports that show which sending sources receivers have seen. Since 2024 Gmail and Yahoo require DMARC from bulk senders. Gmail's threshold is more than 5,000 messages a day to personal Gmail accounts.
- **DKIM: Not visible.** No key found under the usual names. It may exist under another name. DKIM can only be seen for certain inside a real email of yours.

Records and next steps

DMARC - first step, monitoring only

Name `_dmarc.etaireia-sas.example`

Type `TXT`

Value `v=DMARC1; p=none; rua=mailto:dmarc@etaireia-sas.example`

dmarc@etaireia-sas.example must work as a mailbox or a forwarding address; otherwise use an existing address of yours. The aggregate reports arrive there as XML files. p=none asks receivers to take no DMARC-based action on delivery.

SPF is missing. Likely provider that receives your email, from the MX records: Google Workspace

The MX records show where you receive email, not every service that sends with your domain. First confirm every sender: an invoicing program, a newsletter tool or a website form, for example. Then put all of them into the same SPF record.

A look at the public DNS records at the time of the check. It is not a certificate, and it does not show how your messages are delivered. DKIM can only be seen for certain inside a real message.

Want it done and checked for you? Limani Labs, €49 for the first 5 clients, paid only after the re-check shows that it works - andreas@limanilabs.com
